DETAILED ACTION

Continued Examination Under 37 CFR 1.114

1. A request for continued examination under 37 CFR 1.114, including the fee set forth in 37 CFR 1.17(e), was filed in this application after final rejection. Since this application is eligible for continued examination under 37 CFR 1.114, and the fee set forth in 37 CFR 1.17(e) has been timely paid, the finality of the previous Office action has been withdrawn pursuant to 37 CFR 1.114. Applicant's submission filed on February 21, 2005 has been entered.

Claim Rejections - 35 USC § 103

- 2. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
 - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- 3. Claims 4 and 5 are rejected under 35 U.S.C. 103(a) as being unpatentable over U.S. Patent No. 6,428,218 to Müssig in view of U.S. Patent No. 5,570,446 to Zhang.

Regarding to claim 4, Müssig discloses in Figure 1, a method for fusion splicing of an optical fiber using an optical fiber fusion splicer comprising a setting means (first holding device 2 and second holding device 4) for setting respective end surface of two optical fibers (optical conductors 1 and 3) that are to be spliced in order to abut against

Art Unit: 2879

each other (see column 3, lines 10-25), a heating means (two electrodes 6) for generating an arc discharge between two discharge electrodes and heating an abutment portion of the optical fibers (optical conductors 1 and 3) using discharge beam (see column 3, lines 61 to column 4, lines 2), and an image pickup means (sensor 8) for picking up an image of the discharge beam (see column 3, lines 26-39), the method comprising: measuring, from image signals obtained by the image pickup means (sensor 8), estimating a heating center of the arc discharge from the plurality of brightness distributions (see column 4, lines 13-46); and thereafter controlling the heating means such that a main arc discharge is generated and the abutment portion is heated by the discharge beam (see column 3, line 61 to column 4, line 2).

However, Müssig does not disclose a preliminary arc discharge is generated between the discharge electrode when no optical fibers have been placed in a discharge area brightness distribution on a plurality of lines that are set at different positions along a rectilinear direction between the discharge electrodes and run in a direction substantially at right angles to the rectilinear direction; and controlling the setting means such that the abutment portion of the two optical fibers is positioned in the heating center.

The Zhang reference teaches in Figures 1, 2 and 4, a method for fusion splicing an optical fiber, the method comprising: a preliminary are discharge is generated between the discharge electrodes (5) when no optical fiber have been placed in a discharge area (see column 6, lines 17-39) brightness distribution on a plurality of lines that are set at different positions along a rectilinear direction between the discharge electrodes (6) and run in a direction substantially at right angles to the rectilinear direction (see column 5,

Art Unit: 2879

lines 21-42); and controlling the setting means (retainer 41) such that the abutment portion of the two optical fibers (1 and 1') is positioned in the heating center (see column 5, line 62 to column 6, line 16 and column 7, lines 1-23) for the purpose of obtaining a spliced fiber having a large tensile strength and a low attenuation.

Thus, it would have been obvious to one having ordinary skill in the art at the time the invention was made to have utilize the preliminary arc discharge method of Zhang for the splicing optical fiber of Müssig in order to obtain a spliced fiber having a large tensile strength and a low attenuation.

Regarding to claim 5, Zheng teaches in Figures 1, 2 and 4, the preliminary arc discharge in which the brightness distributions are estimated is performed with the current during the preliminary arc discharge smaller than the current during the main arc discharge in which the abutment portion is heated (see column 6, line 40 to column 7, line 23) and the motivation to combine is the same as above.

Response to Arguments

4. Applicant's arguments with respect to claims 4 and 5 have been considered but are moot in view of the new ground(s) of rejection.

Art Unit: 2879

Conclusion

5. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure.

The following prior art are cited to further show the state of the art of a method for fusion splicing of an optical fiber.

- U.S. Patent No. 5,414,788 to Kammlott.
- U.S. Patent No. 5,758,000 to Zheng.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Dalei Dong whose telephone number is (571)272-2370. The examiner can normally be reached on 8 A.M. to 5 P.M..

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Nimeshkumar Patel can be reached on (571)272-2457. The fax phone number for the organization where this application or proceeding is assigned is 703-872-9306.
